CC the invention relates to human nucleic acids (AAI57798-AAI61369) and CC the encoded polypeptides (AAM38642-AAM42213) with nootropic, communosuppressant and cytostatic activity. The polynucleotides are useful confide in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and containing a polypeptide or polynucleotide contains and central nervous system diseases, such as an activity of a lisease, amyotrophic contains and Shy-Drager Syndrome. Other uses include the cutilisation of the activities such as: Immune system suppression, continuation activity, chemotactic/chemokinetic activity, haemostatic assays for receptor activity, arthritis and inflammation, leukaemias and contains an

œ,

(HUMA-) HUMAN GENOME SCI INC.

P-PSDB; ABB89353. 2002-122018/16.

Novel 1405 isolated polypeptides, useful for diagnosis, treatment prevention of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferations. proliferative

Claim 4; SEQ ID NO 324; 2081pp + Sequence Listing; English.

ARESULT 4
AREASULT 4
A The invention relates to novel genes (ABL89449-ABL90853) and proteins (ABB89040-ABB90444) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast can ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune charoiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (c) disease, c) cardiovascular disorders such as myocardial ischaemias; (c) diseasing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences.

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are in gene therapy. A composition containing a polypeptide or polynucl of the invention may be used to treat diseases of the peripheral new system, such as peripheral nervous injuries, peripheral neuropathy. Incalised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome.                                                                                 δÃ
                                                                                                                                                                             The invention relates to novel genes (AAL34669-AAL37666) and proteins (ABB03087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of; (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune discorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and

The invention relates to novel genes (AAL34669-AAL37666) and proteins (ABB3087-ABB94109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast,
                                                                                                                                                                                           Isolated polypeptide for disorders related to the musculoskeletal cancers a diagnosis -
                                                                                                                                                             Example

```
CC and other cardiovascular conditions; treats wounds due to injuries, condurins, post-operative tissue repair, and ulcers; stimulates angiogenesis and imb regeneration; stimulates neuronal growth; can treat and prevent conditions, such as, Alzheimer's disease, Parkinson's disease, and conditions, such as, Alzheimer's disease, Parkinson's disease, and AIDS-related complex; stimulates chondrocyte growth, thus they can be used to enhance bone and periodontal regeneration and aid in tissue cused to enhance bone and periodontal regeneration and aid in tissue cused to enhance bone grafts; prevents skin aging due to sunburn by combors activate hair-forming cells and promotes melanocyte growth; commbers activate hair-forming cells and promotes melanocyte growth; corgans before transplantation or for supporting cells and bone companies before transplantation or for supporting cell culture of primary tissues; induces tissue of mesodermal origin to differentiate in early cembryos; increases or decreases the differentiation or proliferation of cembryonic stem cells, besides, haematopoietic lineage; modulates colour, skin, percentage of adipose tissue, pigmentation, size, and shape (e.g., cosmetic surgery); modulates mammalian metabolism; changes colour, capabilities, depression, tendency for violence, tolerance for pain, created creases increases or decreases storage capabilities, fat content, lipid, protein, carbohydrate, vitamins, minerals, cofactors corporational components. This sequence encodes a novel human capacitors of musculoskeletal system antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           29-SEP-2000

CC polypeptides and polynucleotides and methods for producing such CC polypeptides by recombinant techniques. Also disclosed in the invention CC are methods for utilising uridine kinase polypeptides and polynucleotides CC in diagnostic assays. The polynucleotides and polypeptides of the CC invention may be used as diagnostic reagents by detecting mutations in an CC associated gene. An array of oligonucleotide probes comprising the CC uridine kinase polynucleotide sequence or fragments thereof can be CC constructed to conduct efficient screening of genetic mutations, for CC example. Detection of abnormally decreased or increased levels of CC polypeptide or mRNA expression may also be used for diagnosing or CC determining susceptibility of subject to a disease of the invention. CC The polynucleotide sequences of the invention can be used for chromosome CC localisation studies and tissue expression studies. The polypeptides of the invention or fragments thereof may be used as immunogens to produce CC antibodies. These antibodies may be employed to isolate or identify CC clones expressing the polypeptide. The polypeptides and polynucleotides of the invention can be used as a vaccine or in gene therapy to treat CC diseases such as human ovarian cancer, human colon carcinomas, and CC off a human uridine kinase of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             밁
                The present invention describes primer sets for synthesising 5602 (C full-length cDNAs defined in the specification. Where a primer set (C comprises: (a) an oligo-dT primer and an oligonucleotide complementary to the complementary strand of a polynucleotide which comprises one of (C the 5602 nucleotide sequences defined in the specification, where the coligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the (C complementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence, where the coligonucleotide which comprises a 5'-end sequence of coligonucleotide comprises a 3'-end sequence, where the coligonucleotide comprises a 1-end sequence, where the combination of the specification. The primer sets can be used in antisense therapy and in gene therapy. The primers are useful for synthesising polynucleotides, particularly full-length cDNAs. The primers are also useful for the detection and/or diagnosis of the abnormality of the proteins encoded by (C the full-length cDNAs. The primers allow obtaining of the full-length (CDNAs easily without any specialised methods. AAH03165 to AAH13632 and AAH36316 to AAH13632 represent human amino acid sequences; AAB9546 to AAH3632
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                29-JUL-1999; 99JP-0248036

New disease detection and treatment molecule (MDDT) polynucleotides and polypeptides, useful in diagnosing, studying, preventing or treating diseases associated with MDDT expression, e.g. autoimmune or inflammatory disorders

Claim 1; Page 98; 129pp; English

CC The present invention relates to the isolation of novel human CC molecules for disease detection and treatment (MDDT), and the polynucleotide sequences (mddt) encoding them. The MDDT polypeptides CC may be used to screen for molecules that bind to, or are bound by the encoded polypeptides, and to develop a transcript image of a tissue or CC cell type. Probes comprising at least 20 nucleotides of the mddt CC polynucleotide may be used to assess the toxicity of a test compound. CC The MDDT polypeptides and mddt polynucleotides are useful in the CC diagnosis, study, prevention and treatment of diseases associated with CC disorders include cell proliferative disorders (e.g. arteriosclerosis, CC (e.g. asthma, Crohn's disease, or multiple sclerosis). The mddt CC (e.g. asthma, Crohn's disease, or multiple sclerosis). The mddt CC (e.g. asthma, Crohn's disease, or multiple sclerosis). The mddt CC and in somatic or germline gene therapy. ABS51814 encode CC the MDDT proteins of the invention.

CC HTPS-1 to HTPS-42, and sequences AHAD3801-AHAD3801 are proteins CC encoding them. The proteins play important roles in the regulation of CC cellular signalling and proliferation. The HTPS proteins are useful for CC screening compounds for their effectiveness as agonists or antagonists of transferase activity, or for compounds that specifically bind to an HTPS protein or which modulates the activity of an HTPS protein. HTPS CC paramaceutical compositions comprising an HTPS protein. HTPS grotein are useful for treating a disease or condition associated CC with decreased or increased expression of functional HTPS. Disorders CC which may be treated using such compositions include cell proliferative CC which may be treated using such compositions include cell proliferative CC disease, atopic dermartitis, pancreatitis, pactials, cancers (including breast, bladder, bone marrow, brain and uterus cancer), inflammation, CC metal and haematopoietic cancer, including lymphoma, cirrhosis, Crohn's CC disease, atopic dermartitis, diabetes mellitus, multiple sclerosis, trauma and haematopoietic cancer, including lymphoma, leukaemia and to generate hybridisation probes useful in mapping the naturally concurring genomic sequences. HTPS, and its catalytic or immunogenic confinals to model human diseases, for diagnostic purposes and to generate hybridisation probes useful in mapping the naturally concurring genomic sequences. HTPS, and its catalytic or immunogenic cut and the diagnosis of disorders associated with the expression of CC dargo screening techniques. Antibodies which specifically bind HTPS may be cut of the diagnosis of disorders associated with the expression of CC and for the diagnosis of disorders associated with the expression of CC and for the diagnosis of disorders associated with HTPS or Sequence 1322 BP; 339 A; 359 C; 358 G; 266 T; 0 other; Sequences AAB73494-AAB73535 represent novel human transferase proteins HTFS-1 to HTFS-42, and sequences AAH23801-AAH23842 represent cDNAs

Novel nucleic acids and polypeptides, useful such as central nervous system injuries -
                                                                              IJ
                                                                              NO
                                                                             53; 10078pp;
                                                                             English
                                                                                          treating
                                                                                           disorders
```

Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and assays for receptor activity, arthritis and inflammation, leukaemias and The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies addenical nervous system diseases, such as C.N.S disorders.
Note: The sequence specification. data for this patent did not form part ō, the printed

Submitted (06-OCT-2001) Sanger Centre, Hinxton, Cambridgeshire, CB10 15A, UK. E-mail enquiries: humquery@sanger.ac.uk Clone request@sanger.ac.uk
On Apr 21, 2001 this sequence version replaced gi:13396549.
During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em:, EMBL; Sw:, SWISSPROT; TT., TREMBL; Wp:, WORMPEP; Information on the WORMPEP
                                                                                                                                                                                                                1045
